# Dual Trapezoidal Fuzzy Number and its Applications 

J. Jon Arockiaraj ${ }^{1}$, S. Revathy ${ }^{2}$<br>${ }^{1}$ Head and Assistant Professor, ${ }^{2}$ Research Scholar<br>${ }^{12}$ Department of Mathematics, St. Joseph's college of Arts and Science Cuddalore India<br>Email: jonarockiaraj@ gmail.com , revathysekarbsr@ gmail.com

Abstract- In this Paper, we introduce Convergence of $\alpha$-Cut. We define at Which point the $\alpha$-Cut converges to the fuzzy numbers and it will be illustrated by example using dual trapezoidal fuzzy number and some mensuration problems are illustrated with approximated values.

Key Words: Fuzzy number, $\alpha$-Cut, Dual trapezoidal fuzzy number, Defuzzification.

## I. INTRODUCTION

In 1965 Lotfi. A. Zadeh introduced fuzzy set theory. Fuzzy numbers were first introduced by Zadeh in 1975.There after theory of fuzzy number was further studied and developed by Dubois and Prade, R.Yager Mizomoto, J.Buckly and Many others. Since then many workers studied the theory of fuzzy numbers and achieved fruitful results. The fuzziness can be represented by different ways one of the most useful representation is membership function. So far fuzzy numbers like triangular fuzzy number, trapezoidal fuzzy numbers, pentagonal, hexagonal, octagonal, pyramid and diamond fuzzy numbers etc. These numbers have got many applications in operation research, engineering and mathematical science. In this paper, we introduce Dual trapezoidal fuzzy numbers with its membership functions and its applications. Section one presents the introduction, section two presents the basic definition of fuzzy numbers section three presents Dual trapezoidal fuzzy numbers and its applications and in the final section we give conclusion.

## II. BASIC DEFINITIONS

Definition 2.1: (Fuzzy set)
If $X$ is a universe of discourse and $x$ be any particular element of $X$ then a fuzzy set $A$ defined on $X$ may be written as a collection of ordered pairs $A=\left\{\left(x, \mu_{A}(x)\right)\right.$ : $\left.x \in X\right\}$. Here $\mu_{A}(x)$ : $x \rightarrow[0,1]$ is a mapping called the degree of membership function of the fuzzy set A.
Definition 2.2: (Fuzzy Number)A fuzzy set A defined on the universal set of real number $R$ is said to be a fuzzy number if its membership function has satisfy the following characteristics.
(i) $\mu_{\mathrm{A}}(\mathrm{x})$ is a piecewise continuous
(ii) A is convex, i.e., $\mu_{\mathrm{A}}\left(\alpha \mathrm{x}_{1}+(1-\alpha) \mathrm{x}_{2}\right) \geq \min \left(\mu_{\mathrm{A}}\left(\mathrm{x}_{1}\right), \mu_{\mathrm{A}}\left(\mathrm{x}_{2}\right)\right)$ $y x_{1}, x_{2} \in R \quad y \alpha \in[0,1]$
(iii) $A$ is normal, i.e., there exist $x_{0} \in R$ such that $\mu_{A}\left(x_{0}\right)=1$

Definition 2.3: (Trapezoidal Fuzzy Number)
A trapezoidal fuzzy number represented with four points as A $=(\mathrm{abcc})$, Where all $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ are real numbers and its membership function is given below where $\mathrm{a} \leq \mathrm{b} \leq \mathrm{c} \leq \mathrm{d}$

$$
\mu_{\mathrm{A}}(\mathrm{x})= \begin{cases}\frac{x-a}{b-a} & \text { for } a \leq x \leq b \\ 1 & \text { for } b \leq x \leq c \\ \frac{d-x}{d-c} & \text { for } c \leq x \leq d \\ 0 & \text { for } x>d\end{cases}
$$

## III. DUAL TRAPEZOIDAL FUZZY NUMBER

A. Definition (Dual Trapezoidal Fuzzy Number)

A Dual Trapezoidal fuzzy number of a fuzzy set A is defined as $\mathrm{A}_{\mathrm{DT}}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}(\alpha)\}$ Where all $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ are real numbers and its membership function is given below where $a \leq b \leq c \leq d$

$$
\mu_{\mathrm{DT}}(\mathrm{x})=\left\{\begin{array}{cc}
0 & \text { for } \quad x<a \\
\frac{x-a}{b-a} & \text { for } a \leq x \leq b \\
1 & \text { for } b \leq x \leq c \\
\frac{d-x}{d-c} & \text { for } c \leq x \leq d \\
\frac{a-x}{a-b} & \text { for } a \leq x \leq b \\
1 & \text { for } b \leq x \leq c \\
\frac{x-d}{c-d} & \text { for } c \leq x \leq d \\
0 & \text { otherwise }
\end{array}\right.
$$

where $\alpha$ is the base of the trapezoidal and also for the inverted reflection of the above trapezoidal namely abcd.

Fig 1: Graphical Representation of Dual Trapezoidal fuzzy Number

## B. Defuzzification

Let $A_{D T}=(a, b, c, d, \boldsymbol{\alpha})$ be a dual trapezoidal fuzzy number .The defuzzification value of $A_{D T}$ is an approximate real number. There are many method for defuzzification such as center of area method, mean of maxima method, weighted average method etc. In this paper we have used centroid area method for defuzzification.

## a) Centroid of Area Method:

Centroid of area method or centre of gravity method. It obtains the centre of area $\left(\mathrm{X}^{*}\right)$ occupied by the fuzzy sets.It can be expressed as

$$
\mathrm{X}^{*}=\frac{\int\left(x \cdot \mu_{D T}(x)\right)}{\int\left(\mu_{D T}(x)\right)}
$$

Defuzzification Value for dual trapezoidal fuzzy number:
Let $\mathrm{A}_{\mathrm{DT}}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}(\alpha)\}$ be a DTrFN with its membership function

$$
\mu_{\mathrm{DT}}(\mathrm{x})= \begin{cases}0 & \text { for } \quad x<a \\ \frac{x-a}{b-a} & \text { for } a \leq x \leq b \\ 1 & \text { for } b \leq x \leq c \\ \frac{d-x}{d-c} & \text { for } \quad c \leq x \leq d \\ \frac{a-x}{a} & \text { for } \quad \text { base } \\ 1 \leq x \leq b \\ \frac{x-d}{c-d} & \text { for } \quad b \leq x \leq c \\ \text { for } & c \leq x \leq d\end{cases}
$$

Using centroid area method

Fig 2 : Graphical Representation of Centroid area method DTrFN

$$
\begin{aligned}
& \int\left(x \cdot \mu_{D T}(x)\right)= \\
& \int_{a}^{b} \frac{x(x-a)}{b-a} d x+\int_{b}^{c} x d x+\int_{c}^{d} \frac{x(d-x)}{d-c} \mathrm{dx}+\int_{a}^{b} \frac{x(a-x)}{a-b} d x+\int_{b}^{c} x d x+ \\
& \int_{c}^{d} \frac{x(x-d)}{c-d} \mathrm{dx} \\
& =\frac{1}{b-a}\left[\frac{b^{3}}{3}-\frac{a b^{2}}{2}-\frac{a^{3}}{3}+\frac{a^{3}}{2}\right]+\left[\frac{c^{2}}{2}-\frac{b^{2}}{2}\right]+\frac{1}{d-c}\left[\frac{d^{3}}{2}-\right. \\
& \left.\frac{d c^{2}}{2}-\frac{d^{3}}{3}+\frac{c^{3}}{3}\right]+\left[\frac{c^{2}}{2}-\frac{b^{2}}{2}\right]+ \\
& \frac{1}{a-b}\left[-\frac{b^{3}}{3}+\frac{a b^{2}}{2}-\frac{a^{3}}{2}+\frac{a^{3}}{3}\right]+\frac{1}{c-d}\left[\frac{d^{3}}{3}+\frac{d c^{2}}{2}-\right. \\
& \left.\frac{d^{3}}{2}-\frac{c^{3}}{3}\right] \\
& \underline{4 b^{2}+4 a b+4 a^{2}-4 b^{2}-4 d c-4 c^{2}-6 b^{2}-6 a b-6 a^{2}-6 c^{2}+6 d c+6 d} \\
& =\frac{\mathrm{c}^{2}+\mathrm{d}^{2}-\mathrm{a}^{2}-\mathrm{b}^{2}-\mathrm{ab}+\mathrm{dc}}{3} \\
& \int\left(\mu_{D T}(x)\right)=\int_{a}^{b} \frac{(x-a)}{b-a} d x+\int_{b}^{c} d x+ \\
& \int_{c}^{d} \frac{(d-x)}{d-c} \mathrm{dx}+\int_{a}^{b} \frac{(a-x)}{a-b} d x+\int_{b}^{c} d x+\int_{c}^{d} \frac{(x-d)}{c-d} \mathrm{dx}
\end{aligned}
$$

$$
=\quad \frac{1}{2(b-a)}\left[(b-a)^{2}\right]+[c-b]-\frac{1}{2(d-c)}[-(d-
$$

$\left.c)^{2}\right]-\frac{1}{2(a-b)}\left[(a-b)^{2}\right]+\quad[c-b]+$ $\frac{1}{2(c-d)}\left[-(c-d)^{2}\right]$

$$
\begin{aligned}
& =\frac{-2 a-4 b+2 b+4 c-2 c+2 d}{2} \\
& =c-d+a+b
\end{aligned}
$$

Defuzzification $=\frac{\int\left(x \cdot \mu_{D T}(x)\right)}{\int\left(\mu_{D T}(x)\right)}$

$$
\begin{aligned}
& =\frac{\frac{\mathrm{c}^{2}+\mathrm{d}^{2}-\mathrm{a}^{2}-\mathrm{b}^{2}-\mathrm{ab}+\mathrm{dc}}{3}}{\mathrm{c}+\mathrm{d}-\mathrm{a}-\mathrm{b}} \\
& =\frac{1}{3}\left[d+c+b+a-\frac{c d-a b}{d+c-b-a}\right]
\end{aligned}
$$

## C. Application

In this section, we have discussed the convergence of $\boldsymbol{\alpha}$-cut using the example of dual trapezoidal fuzzy number.

## CONVERGENCE OF $\alpha$-CUT :

Let $A_{D T}=\{a, b, c, d,(\boldsymbol{\alpha})\}$ be a dual trapezoidal fuzzy number whose membership function is given as

$$
\mu_{\mathrm{DT}}(\mathrm{x})=\left\{\begin{array}{ccc}
0 & \text { for } & x<a \\
\frac{x-a}{b-a} & \text { for } a \leq x \leq b \\
1 & \text { for } b \leq x \leq c \\
\frac{d-x}{d-c} & \text { for } \quad c \leq x \leq d \\
\alpha & \text { base } \\
\frac{a-x}{a-b} & \text { for } a \leq x \leq b \\
1 & \text { for } b \leq x \leq c \\
\frac{x-d}{c-d} & \text { for } \quad c \leq x \leq d \\
0 & \text { otherwise }
\end{array}\right.
$$

To find $\boldsymbol{\alpha}$-cut of $A_{D T}$, we first set $\boldsymbol{\alpha} \in[0,1]$ to both left and right reference functions of $\mathrm{A}_{\mathrm{DT} \text {. Expressing } \mathrm{x} \text { in terms of } \boldsymbol{\alpha}, ~}^{\text {. }}$ which gives $\boldsymbol{\alpha}$-cut of $\mathrm{A}_{\mathrm{DT}}$.

$$
\begin{aligned}
\boldsymbol{\alpha} & =\frac{x^{l}-a}{b-a} \\
\Rightarrow \quad \mathrm{x} & =\mathrm{a}+(\mathrm{b}-\mathrm{a}) \boldsymbol{\alpha} \\
\boldsymbol{\alpha} & =\frac{d-x^{r}}{d-c} \\
\Rightarrow \mathrm{x}^{\mathrm{r}} & =\mathrm{d}-(\mathrm{d}-\mathrm{c}) \boldsymbol{\alpha} \\
\Rightarrow \mathrm{A}_{\boldsymbol{\alpha} \mathrm{DT}} & =[\mathrm{a}+(\mathrm{b}-\mathrm{a}) \boldsymbol{\alpha}, \mathrm{d}-(\mathrm{d}-\mathrm{c}) \boldsymbol{\alpha}]
\end{aligned}
$$

Normally to find $\boldsymbol{\alpha}$-cut, for the fuzzy numbers we give $\boldsymbol{\alpha}$ values as 0 or 0.5 or 1 in the interval [ 0,1$]$. Instead of giving these values for $\boldsymbol{\alpha}$. we divide the interval $[0,1]$ as many as possible subinterval. If we give very small values for $\boldsymbol{\alpha}$, the $\boldsymbol{\alpha}$-cut converges to a fuzzy number $[\mathrm{a}, \mathrm{d}]$ in the domain of $X$ it will be illustrated by example as given below.
Example: $A_{D T}=(-6,-4,3,6)$ and its membership function will be

$$
\mu_{\mathrm{DT}}(\mathrm{x})=\left\{\begin{array}{cc}
\frac{x+6}{2} & -6 \leq x \leq-4 \\
1 & -4 \leq x \leq 3 \\
\frac{6-x}{3} & 3 \leq x \leq 6 \\
\frac{-6-x}{-2} & -6 \leq x \leq-4 \\
1 & -4 \leq x \leq 3 \\
\frac{x-6}{-3} & 3 \leq x \leq 6
\end{array}\right.
$$

$$
\begin{aligned}
& \boldsymbol{\alpha} \text { - cut of dual Trapezoidal fuzzy Number } \\
& \begin{array}{l}
\boldsymbol{\alpha}=\left(\mathrm{x}^{1}+6\right) / 2 \\
\boldsymbol{\alpha}=\left(6-\mathrm{x}^{\mathrm{r}}\right) / 3 \\
\\
\Rightarrow \mathrm{X}^{1}=2 \boldsymbol{\alpha}-6 \\
\Rightarrow \mathrm{X}^{\mathrm{r}}=6-3 \boldsymbol{\alpha} \\
\end{array} \begin{array}{|l}
\mathrm{DT} \boldsymbol{\alpha}=[2 \boldsymbol{\alpha}-6,6-3 \boldsymbol{\alpha}]
\end{array}
\end{aligned}
$$

When $\boldsymbol{\alpha}=1 / 10$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.8,5.7]$
When $\boldsymbol{\alpha}=1 / 10^{2}$ then $\mathrm{A}_{\mathrm{DT}}=[-5.98,5.97]$
When $\boldsymbol{\alpha}=1 / 10^{3}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.998,5.997]$
When $\boldsymbol{\alpha}=1 / 10^{4}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.9998,5.9997]$
When $\boldsymbol{\alpha}=1 / 10^{5}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.99998,5.99997]$
When $\boldsymbol{\alpha}=1 / 10^{6}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.999998,5.999997]$
When $\boldsymbol{\alpha}=1 / 10^{7}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.9999998,5.9999997]$
When $\boldsymbol{\alpha}=1 / 10^{8}$ then $\mathrm{A}_{\text {DT } \boldsymbol{\alpha}}=[-5.99999998,5.99999997]$
When $\boldsymbol{\alpha}=1 / 10^{9}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.999999998,5.999999997]$
When $\boldsymbol{\alpha}=1 / 10^{10}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-6,6]$
When $\boldsymbol{\alpha}=1 / 10^{11}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-6,6]$
When $\boldsymbol{\alpha}=1 / 10^{12}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-6,6]$
When $\boldsymbol{\alpha}=1 / 10^{13}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-6,6]$
................................etc
When $\boldsymbol{\alpha}=1 / 10^{\mathrm{n}}$ as $\mathrm{n} \rightarrow \infty$ then the $\boldsymbol{\alpha}$-cut converges to $A_{D T \alpha}=[-6,6]$

Fig 3: Graphical Representation of convergence of $\boldsymbol{\alpha}$-cut
When $\boldsymbol{\alpha}=2 / 10$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.6,5.4]$
When $\boldsymbol{\alpha}=2 / 10^{2}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha} \boldsymbol{\alpha}}=[-5.96,5.94]$
When $\boldsymbol{\alpha}=2 / 10^{3}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.996,5.994]$
When $\boldsymbol{\alpha}=2 / 10^{4}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.9996,5.9994]$
When $\boldsymbol{\alpha}=2 / 10^{5}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.99996,5.99994]$
When $\boldsymbol{\alpha}=2 / 10^{6}$ then $\mathrm{A}_{\mathrm{DT} \alpha}=[-5.999996,5.999994]$
When $\boldsymbol{\alpha}=2 / 10^{7}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.9999996,5.9999994]$
When $\boldsymbol{\alpha}=2 / 10^{8}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.99999996$,
5.99999994]

When $\boldsymbol{\alpha}=2 / 10^{9}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-5.999999996$,
5.999999994]

When $\boldsymbol{\alpha}=2 / 10^{10}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-6,6]$
When $\boldsymbol{\alpha}=2 / 10^{11}$ then $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[-6,6]$
When $\boldsymbol{\alpha}=2 / 10^{12}$ then $A_{D T \boldsymbol{\alpha}}=[-6,6]$
When $\boldsymbol{\alpha}=2 / 10^{13}$ then $\mathrm{A}_{\text {DT } \alpha}=[-6,6]$

When $\boldsymbol{\alpha}=2 / 10^{\mathrm{n}}$ as $\mathrm{n} \rightarrow \infty$ then the $\boldsymbol{\alpha}$-cut converges to $\mathrm{A}_{\mathrm{DT} \boldsymbol{\alpha}}=[$ 6,6 ]

Fig 4: Graphical Representation of convergence of $\boldsymbol{\alpha}$-cut
Similarly, $\quad \boldsymbol{\alpha}=3 / 10^{\mathrm{n}}, 4 / 10^{\mathrm{n}}, 5 / 10^{\mathrm{n}}, 6 / 10^{\mathrm{n}}, 7 / 10^{\mathrm{n}}, 8 / 10^{\mathrm{n}}, 9 / 10^{\mathrm{n}}, 10 / 10^{\mathrm{n}}$ upto these value n varies from 1to $\infty$ after
 varies from 2 to $\infty$ and and101/10 $0^{n}, 102 / 10^{n}$ $103 / 10^{n} \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots$ as $n$ varies from 3 to $\infty$ and the process is goes on like this if we give the value for $\boldsymbol{\alpha}$ it will converges to the dual trapezoidal fuzzy number[-6,6]
From the above example we conclude that, as $n$ tends to $\infty$ the $\alpha$-Cut converges to the fuzzy number [a, d] in the domain of X. In other words we say that $\left\{\mathrm{K} / 10^{\mathrm{n}}\right\}$ if we give different values for $K$ as $n$ - varies up to $\infty$ if we put as $n$ tends to $\infty$ then the value of $A_{D T \alpha}$ converges to the fuzzy number $[a, d]$ in the domain X .

## D. Applications

In this section we have solved some elementary problems of mensuration using defuzzified centroid area method.
a) Perimeter of Rectangle

Let the length and breadth of a rectangle are two positive dual trapezoidal fuzzy numbers $A_{D T}=(10 \mathrm{~cm}, 11 \mathrm{~cm}, 12 \mathrm{~cm}, 13 \mathrm{~cm})$ and $B_{D T}=(4 \mathrm{~cm}, 5 \mathrm{~cm}, 6 \mathrm{~cm}, 7 \mathrm{~cm})$ then perimeter $C_{D T}$ of rectangle is $2\left[\mathrm{~A}_{\mathrm{DT}}+\mathrm{B}_{\mathrm{DT}}\right]$

Therefore the perimeter of the rectangle is a dual trapezoidal fuzzy number $C_{D T}=(28 \mathrm{~cm}, 32 \mathrm{~cm}, 36 \mathrm{~cm}, 40 \mathrm{~cm})$ and its membership functions

Fig 5: Rough sketch of membership function of CDT.
Aproximately the perimeter of the rectangle takes the values between 32 to 36 .

> Centroid area method:

$$
\begin{aligned}
\mathrm{X}^{*} & =\frac{1}{3}\left[d+c+b+a-\frac{c d-a b}{d+c-b-a}\right] \\
& =\frac{1}{3}\left[28+32+36+40-\frac{36 \times 40-28 \times 32}{40+36-32-28}\right] \\
& =\frac{1}{3}\left[136-\frac{1440-896}{76-60}\right] \\
& =\frac{1}{3}\left[136-\frac{544}{16}\right] \\
& =34
\end{aligned}
$$

The approximate value of the perimeter of the rectangle is 34 cm .
b) Length of Rod

Let length of a rod is a positive $\mathrm{DTrFN} \mathrm{A}_{\mathrm{DT}}=$ $(10 \mathrm{~cm}, 11 \mathrm{~cm}, 12 \mathrm{~cm}, 13 \mathrm{~cm})$. If the length $B_{\mathrm{DT}}=(5 \mathrm{~cm}, 6 \mathrm{~cm}$, $7 \mathrm{~cm}, 8 \mathrm{~cm}$ ) a DTrFN is cut off from this rod then the remaining length of the $\operatorname{rod} \mathrm{C}_{\mathrm{DT}}$ is $\left[\mathrm{A}_{\mathrm{DT}}(-) \mathrm{B}_{\mathrm{DT}}\right]$
The remaining length of the rod is a $\mathrm{DTrFN} \mathrm{C}_{\mathrm{DT}}=(2 \mathrm{~cm}, 4 \mathrm{~cm}$, $6 \mathrm{~cm}, 8 \mathrm{~cm}$ ) and its membership function

Fig 6: Rough sketch of membership function of CDT.

$$
\mu_{\mathrm{DT}}(\mathrm{x})=\left\{\begin{array}{cc}
\frac{x-2}{2} & 2 \leq x \leq 4 \\
1 & 4 \leq x \leq 6 \\
\frac{8-x}{2} & 6 \leq x \leq 8 \\
\frac{2-x}{-2} & 2 \leq x \leq 4 \\
1 & 4 \leq x \leq 6 \\
\frac{x-8}{-2} & 6 \leq x \leq 8
\end{array}\right.
$$

Approximately the length of the rod takes the value between 4 cm and 6 cm .

Centroid area method:

$$
\begin{aligned}
X^{*} & =\frac{1}{3}\left[d+c+b+a-\frac{c d-a b}{d+c-b-a}\right] \\
& =\frac{1}{3}\left[2+4+6+8-\frac{6 \times 8-2 \times 4}{6+8-2-4}\right] \\
& =\frac{1}{3}\left[20-\frac{48-8}{18-10}\right] \\
& =\frac{1}{3}\left[20-\frac{40}{8}\right] \\
& =5
\end{aligned}
$$

The approximate value of the remaining length of the rod is 5 cm .

## c) Length of a Rectangle

Let the area and breadth of a rectangle are two positive dual trapezoidal fuzzy number $A_{D T}=(36 \mathrm{~cm}, 40 \mathrm{~cm}, 44 \mathrm{~cm}$, $48 \mathrm{~cm})$ and $\mathrm{B}_{\mathrm{DT}}=(3 \mathrm{~cm}, 4 \mathrm{~cm}, 5 \mathrm{~cm}, 6 \mathrm{~cm})$ then the length $\mathrm{C}_{\mathrm{DT}}$ of the rectangle is $\mathrm{A}_{\mathrm{DT}}(:) \mathrm{B}_{\mathrm{DT}}$. Therefore the length of the rectangle is a dual trapezoidal fuzzy number $C_{D T}=(6 \mathrm{~cm}, 8 \mathrm{~cm}, 11 \mathrm{~cm}, 16 \mathrm{~cm})$ and its membership functions

$$
\mu_{\mathrm{DT}}(\mathrm{x})= \begin{cases}\frac{x-6}{2} & 6 \leq x \leq 8 \\ 1 & 8 \leq x \leq 11 \\ \frac{16-x}{5} & 11 \leq x \leq 16 \\ \frac{6-x}{-2} & 6 \leq x \leq 8 \\ 1 & 8 \leq x \leq 11 \\ \frac{x-16}{-5} & 11 \leq x \leq 16\end{cases}
$$

Fig 7: Rough sketch of membership function of CDT.
Approximately the length of the rectangle takes the value between 8 cm and 11 cm .

Centroid area method

$$
\begin{aligned}
X^{*} & =\frac{1}{3}\left[d+c+b+a-\frac{c d-a b}{d+c-b-a}\right] \\
& =\frac{1}{3}\left[6+8+11+16-\frac{16 \times 11-6 \times 8}{16+11-8-6}\right]
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{3}\left[41-\frac{176-48}{27-14}\right] \\
& =10.38
\end{aligned}
$$

The approximate value of the length of the rectangle is 10.38 cm .
d) Area of the Rectangle

Let the length and breadth of a rectangle are two positive dual trapezoidal fuzzy numbers $A_{D T}=(3 \mathrm{~cm}, 4 \mathrm{~cm}, 5 \mathrm{~cm}, 6 \mathrm{~cm})$ and $\mathrm{B}_{\mathrm{DT}}=(8 \mathrm{~cm}, 9 \mathrm{~cm}, 10 \mathrm{~cm}, 11 \mathrm{~cm})$ then the area of rectangle is $\mathrm{A}_{\mathrm{DT}}\left(\right.$.) $\mathrm{B}_{\mathrm{DT}}$ Therefore the area of the rectangle is a dual trapezoidal fuzzy number $C_{D T}=(24 \mathrm{~cm}, 36 \mathrm{~cm}, 50 \mathrm{~cm}, 66 \mathrm{~cm})$ and its membership functions.

Fig 8: Rough sketch of membership function of CDT.

$$
\mu_{\mathrm{DT}}(\mathrm{x})=\left\{\begin{array}{cc}
\frac{x-24}{12} & 24 \leq x \leq 36 \\
1 & 36 \leq x \leq 50 \\
\frac{66-x}{16} & 50 \leq x \leq 66 \\
\frac{24-x}{-12} & 24 \leq x \leq 36 \\
1 & 36 \leq x \leq 50 \\
\frac{x-66}{-16} & 50 \leq x \leq 66
\end{array}\right.
$$

Approximately the area of the reactangle takes the value between 36 and 50 .

Centroid area method

$$
\begin{aligned}
\mathrm{X}^{*} & =\frac{1}{3}\left[d+c+b+a-\frac{c d-a b}{d+c-b-a}\right] \\
& =\frac{1}{3}\left[24+36+50+66-\frac{50 \times 66-36 \times 24}{66+50-24-36}\right] \\
& =\frac{1}{3}\left[176-\frac{3300-864}{116-60}\right] \\
& =44.167 \mathrm{sq} . \mathrm{cm}
\end{aligned}
$$

The approximate value of the area of the rectangle is $44.167 \mathrm{sq} . \mathrm{cm}$.

## IV. CONCLUSION

In this paper, we have worked on DTrFN .We has discussed about the Convergence of $\alpha$-Cut to the fuzzy numbers. And we have solved numerically some problems of mensuration based on operations using DTrFN and we have calculated the approximate values. Further these applications will be used in various problem of engineering and mathematical science.
